Capstone Abstract

Campus Connect is a universal application targeted towards college campuses. It is the medium for student organizations and the school to post events happening around campus for students to see. We have two sides of the application: the student and the organization.

It is a source for students to see the events happening around campus in a universal feed inside the application. The location of these events is also recorded so students can even view these events based on location. We also know that some students are only interested in certain types of events and organizations so we provided filters to allow them to get a custom feed. Students are able to check in to events and even comment on them to get the discussion going before the event starts. We added a personal touch by allowing students to have a profile where they can upload a picture and rack up "karma points" for contributing to the application.

For organizations, we wanted it to be easy to just set up and to post events as soon as possible. The leaders of these organizations can be requested to become a verified user, in order to post, edit, and delete their own events. Once verified, adding events is as simple as filling out a quick form to give details of the event. Using information like location and type of event helps the organization reach the students they want, without dealing with any hassle of getting the information out there.
